

DICTIONARY SCRIPT INTERFACE

View online: <https://www.construct.net/en/make-games/manuals/construct-3/scripting/scripting-reference/plugin-interfaces/dictionary>

The `IDictionaryInstance` interface derives from `IInstance` to add APIs specific to the **Dictionary** plugin.

*The Dictionary object can only use strings as keys, and strings/numbers as values, since these are the only types supported by the plugin. Use your own independent JavaScript **Maps** to use other types.*

Dictionary APIs

getDataMap()

Return the **Map** which is used as the underlying data storage for the Dictionary object. This allows access to add, change, remove and iterate items.

Only use string keys, and only store number or string primitives as key values, or the plugin will cease to work correctly.
