

ILANG INTERFACE

The `ILang` interface allows for looking up translated strings in the language file.

⚠ Only look up language strings from your own addon. Any other strings in the language file are subject to change at any time.

Methods

`PushContext(prefix)`

Push a prefix to the context stack. For example `PushContext("foo")` followed by `Get(".bar")` will return the same string as if `Get("foo.bar")` were used. Pushing a context beginning with a dot will append to the current prefix, but pushing an entry not beginning with a dot will reset the current prefix. **Note:** be sure to always call `PopContext()` afterwards.

`PopContext()`

Pop a prefix from the context stack.

`Get(context)`

Look up a string in the language file. If the context begins with a dot, it is relative to the current context prefix. Otherwise it is treated as an absolute context.

⚠ For convenience Construct also adds this method as a global function `self.lang()`.
