

IZIPFILE INTERFACE

The `IZipFile` interface represents a zip file in the SDK. It allows access to the file list and reading files contained within the zip.

Methods

`PathExists(path)`

Return a boolean indicating if a given path exists within the zip.

`GetFileList()`

Return an array of all file paths contained within the zip.

`GetFirstEntryWithExtension(ext)`

Return a `IZipFileEntry` representing the first entry found with a given file extension, or `null` if none was found.

`GetEntry(path)`

Return a `IZipFileEntry` representing the file at the given path. If the path does not exist in the zip, this returns `null`.

`ReadText(entry)`

Return a promise that resolves with the contents of the given `IZipFileEntry` read as plain text.

`ReadJson(entry)`

Return a promise that resolves with the contents of the given `IZipFileEntry`, read as plain text and then parsed as JSON.

`ReadBlob(entry)`

Return a promise that resolves with the contents of the given `IZipFileEntry`, read as a `Blob`. (This is a raw binary format that can be read with other JavaScript APIs.)

The returned blob will have `name` and `lastModified` properties added, reflecting the properties of the file in the zip.
