

ICOLLISIONPOLY INTERFACE

The `ICollisionPoly` interface represents the collision polygon for an `IAnimationFrame`. It is represented as a list of numbers representing points connected in a loop. As with image points, the collision polygon points are specified in texture co-ordinates, i.e. from 0 to 1.

Methods

`Reset()`

Reset the collision polygon to the default, which matches the bounding box of the object.

`IsDefault()`

Return a boolean indicating if the collision polygon is set to the default, matching the bounding box of the object.

`GetPoints()`

Return an array of numbers representing the points in the collision polygon. The array elements are alternating X and Y components for the points, so its size is always even. The collision polygon is guaranteed to have at least three points.

`SetPoints(arr)`

Set the collision polygon points by passing an array of numbers. The array elements must be alternating X and Y components for the points, so its size must be even. There must be at least three points in a collision polygon, therefore the passed array must have at least 6 elements.
