

ICONTAINER INTERFACE

The `IContainer` interface represents a container in Construct, which is a group of object types that are always created, destroyed and picked together.

Methods

`GetMembers()`

Return an array of `IObjectType` representing the object types in the container. Containers always have at least two members.

`SetSelectMode(m)`

`GetSelectMode()`

Set or get the select mode of the container, corresponding to the *Select mode* property in Construct. Allowed modes are `"normal"`, `"all"` and `"wrap"`.

`RemoveObjectType(objectType)`

Remove a member `IObjectType` from this container.

A container must have at least two object types. If the second-last member is removed, the container becomes inactive and is effectively deleted. The last remaining member will also act as if it's no longer in a container.

`IsActive()`

Return a boolean indicating if the container is active. It becomes inactive if there are fewer than the minimum required two members, at which point it is effectively deleted.
