

CULTURE FORMATTING IN API REQUESTS

Overview

You can optionally pass a culture code with all requests with the parameter `culture`. If you do not specify a culture code in the request, the culture code of the requested **language** of the request will be used.

The culture code is used to format various data types such as numbers and dates. For example, an API request may return a property such as "totalScores" which may have a value such as `190318`. Sometimes there will be a second property called "formattedTotalScores" which will return the culture specific string formatted value, in this instance `190,318` for the `en-us` culture code. The **pagination object** is a good example of how these values are specified.

Supported Culture Codes
