

DOMINSTANCE SCRIPT INTERFACE

The `IDOMInstance` script interface represents a single instance of an object type (represented by `IObjectClass`) that appears in a layout and represents a DOM element such as a button or other form control at runtime. It derives from the `IWorldInstance` script interface.

Note these methods can still be used in worker mode, since it does not directly access a DOM element.

DOMInstance APIs

`focus()`

`blur()`

Focus or blur the DOM element represented by this instance.

`setCssStyle(prop, val)`

Apply a CSS style to the DOM element, using a string of the property name (in CSS format, e.g. `"background-color"` and a string of the property value (e.g. `"red"`).

`getElement()`

Return the HTML element used to represent the object.

Since the DOM APIs are not available in worker mode, this will throw an exception when running in a Web Worker.
