

# DICTIONARY SCRIPT INTERFACE

The `IDictionaryInstance` interface derives from `IInstance` to add APIs specific to the [Dictionary plugin](#).

⚠ The Dictionary object can only use strings as keys, and strings/numbers as values, since these are the only types supported by the plugin. Use your own independent JavaScript [Maps](#) to use other types.

## Dictionary APIs

### `getDataMap()`

Return the [Map](#) which is used as the underlying data storage for the Dictionary object. This allows access to add, change, remove and iterate items.

⚠ Only use string keys, and only store number or string primitives as key values, or the plugin will cease to work correctly.
