ILANG INTERFACE

View online: https://www.construct.net/en/make-games/manuals/addon-sdk/reference/misc-interfaces/ilang

The `ILang` interface allows for looking up translated strings in the language file.

> *Only look up language strings from your own addon. Any other strings in the language file are subject to change at any time.*

Methods

PushContext(prefix)

Push a prefix to the context stack. For example `PushContext("foo")` followed by `Get(".bar")` will return the same string as if `Get("foo.bar")` were used. Pushing a context beginning with a dot will append to the current prefix, but pushing an entry not beginning with a dot will reset the current prefix. **Note:** be sure to always call `PopContext()` afterwards.

PopContext()

Pop a prefix from the context stack.

Get(context)

Look up a string in the language file. If the context begins with a dot, it is relative to the current context prefix. Otherwise it is treated as an absolute context.

> *For convenience Construct also adds this method as a global function* `self.Lang()`.
