IBEHAVIORINSTANCE INTERFACE

View online: https://www.construct.net/en/make-games/manuals/addon-sdk/reference/object-interfaces/ibehaviorinstance

The `IBehaviorInstance` interface represents a behavior instance in Construct.

Methods

GetProject()

Return the IProject representing the behavior instance's associated project.

GetObjectInstance()

Returns an IObjectInstance or IWorldInstance (depending on the type of object) of the object instance associated with this behavior instance.

GetPropertyValue(id)

Get the value of a behavior property for this behavior instance by its property ID.

SetPropertyValue(id, value)

Set the value of a behavior property for this instance by its property ID.

GetExternalSdkInstance()

Return the custom behavior-specific SDK editor instance class for this behavior instance, which will be a derivative of IBehaviorInstanceBase. For example if called for a behavior instance of the addon SDK's sample behavior, this would return the `MyCustomBehaviorInstance` class. This method can only be used for installed addons - it will return `null` for any built-in behaviors.

Be careful if taking a dependency on a behavior class provided by another developer. Make sure to only use documented and supported methods. If you use features which are changed or removed by a future addon update, then your addon may crash the editor. Scirra will not provide support for crashes involving third-party addons and we will direct affected users to contact the addon developer.
