ICONTAINER INTERFACE

View online: https://www.construct.net/en/make-games/manuals/addon-sdk/reference/object-interfaces/icontainer

The `IContainer` interface represents a container in Construct, which is a group of object types that are always created, destroyed and picked together.

Methods

GetMembers()

Return an array of IObjectType representing the object types in the container. Containers always have at least two members.

SetSelectMode(m)

GetSelectMode()

Set or get the select mode of the container, corresponding to the *Select mode* property in Construct. Allowed modes are `"normal"`, `"all"` and `"wrap"`.

RemoveObjectType(objectType)

Remove a member IObjectType from this container.

> *A container must have at least two object types. If the second-last member is removed, the container becomes inactive and is effectively deleted. The last remaining member will also act as if it's no longer in a container.*

IsActive()

Return a boolean indicating if the container is active. It becomes inactive if there are fewer than the minimum required two members, at which point it is effectively deleted.
