IOBJECTINSTANCE INTERFACE

View online: https://www.construct.net/en/make-games/manuals/addon-sdk/reference/object-interfaces/iobjectinstance

The `IObjectInstance` interface represents an instance in Construct.

Methods

GetProject()

Return the IProject representing the instance's associated project.

GetObjectType()

Return the associated IObjectType interface for this instance.

GetUID()

Return the UID (unique ID) the editor has assigned to this instance.

GetPropertyValue(id)

Get the value of a plugin property for this instance by its property ID. Color properties return a SDK.Color.

SetPropertyValue(id, value)

Set the value of a plugin property for this instance by its property ID. For color properties a SDK.Color must be passed as the value.

GetExternalSdkInstance()

Return the custom plugin-specific SDK editor instance class for this object instance, which will be a derivative of IInstanceBase. For example if called for an instance of the addon SDK's *drawingPlugin* sample, this would return the `MyDrawingInstance` class. This method can only be used for installed addons - it will return `null` for any built-in plugins.

> *Be careful if taking a dependency on a class provided by another developer. Make sure to only use documented and supported methods. If you use features which are changed or removed by a future addon update, then your addon may crash the editor. Scirra will not provide support for crashes involving third-party addons and we will direct affected users to contact the addon developer.*
