WINDOWS WRAPPER OPTIONS DIALOG

View online: https://www.construct.net/en/make-games/manuals/construct-3/interface/dialogs/windows-wrapper-options

The **Windows wrapper options** dialog allows you to customize a Windows wrapper (WebView2) export Paid plans only.

The Windows wrapper options dialog.

The following options are available.

Platforms

Select which platforms are exported. You can choose between Windows 64-bit (for Intel-compatible systems, technically referred to as x64), and Windows ARM64 (for Windows on 64-bit ARM-based chips).

Bundle

Choose an option for bundling the various project files that are exported. The options are:

- **None:** all exported project files are placed in a subfolder named *www* inside the app. It is possible inquisitive users could find some of your project's assets in here, including artwork, music and sound effects.

- **Assets:** combines all the exported project files into a single file named *assets.dat*. This file is not encrypted, but it does prevent casual browsing of the exported files. Using this option should not significantly impact performance.

- **Single file:** allows combining the entire exported project into a single executable file. After the export, you must first run *PackToSingleExecutable.exe* to perform the final step that creates the packed executable file. This bundling option may have some performance overhead when running the app, so may be unsuitable for large projects.

  Some antivirus tools can incorrectly determine that large executable files with a lot of data in them are suspicious. If you encounter problems with false positive antivirus or malware reports using this mode, try using Assets bundling mode instead.

Enable DevTools

Whether the app should allow opening the Microsoft Edge DevTools by pressing F12 or using the *Inspect* context menu option. This is useful for development purposes.

Window caption

Whether the application window includes the system-provided caption and border.

Unchecking this also disables resizing the window.

Resizable window

Whether the application window can be resized by the user. If disabled the window can still be made fullscreen using events.

Ignore GPU blacklist

Some systems with poor quality graphics drivers can end up crashing or causing severe display glitches when running games. Browsers provide blacklists to recognise faulty drivers or hardware and fall back to software rendering. This guarantees the game will work, but can result in poor performance on such systems. Disabling this option always uses GPU rendering which can be much faster, but can then run in to issues on systems with poor quality drivers.

Export for Steam

Adjusts the configuration of the exported project to work better with Steam, such as to support the Steam Overlay. For more information see the Steamworks plugin documentation. Leave this unchecked if you are not exporting for Steam specifically.

Export for Remote Preview

If enabled this exports the project with all its resources and extensions, but the app itself will show preview.construct.net. This allows it to be used to load a Remote Preview from Construct, allowing faster testing with WebView2-specific features enabled.

Command line options

This option allows advanced users to customise the Chromium command-line arguments used by WebView2.
